

MIS Homework 1

Xinhao Du

January 2023

Problem 1.8

Solution: The total profit is $\sum_i p_i s_i = p^\top s$.

Problem 1.11

a

Solution: $1^\top w$ is total counts of words in the document.

b

Solution: $w_{282} = 0$ means that No.282 word is null.

c

Solution: $h = w/1^\top w$.

Problem 1.19

a

Solution: The prediction is $\hat{z}_{t+1} \approx z_t$, which means the prediction of tomorrow's value is approximately equal to today's value.

b

Solution: The prediction is $\hat{z}_{t+1} \approx z_t + (z_t - z_{t-1})$, which means the prediction of tomorrow's value is made by the difference between today's value and yesterday's value.

c

Solution: The prediction is $\hat{z}_{t+1} \approx z_{t-6}$, which means the prediction of tomorrow's value is approximately equal to the value one week ago.

d

Solution: The prediction is $\hat{z}_{t+1} \approx 0.5(z_t + z_{t-1})$, which means the prediction of tomorrow's value is made by the the average of today's value and yesterday's value.

Problem A1.2

a

```
x=rand(10)
a=zeros(10)
a[5]=1
import LinearAlgebra.dot
println(dot(a,x))
```

b

```
x=rand(3)
a=[0.3;0.4;0.3]
import LinearAlgebra.dot
println(dot(a,x))
```

c

```
x=rand(22)
a=zeros(22)
for i in 1:22
    if i%4==0
        a[i]=1
    elseif i%7==0
        a[i]=-1
    end
end
import LinearAlgebra.dot
println(dot(a,x))
```

d

```
x = rand(11)
a = zeros(11)
a[4:8] = ones(5)
import LinearAlgebra.dot
y=dot(a,x)/5
println(y)
```

Problem A1.10

Solution:

When $\gamma = 1$, and the sum of vector is to

$$\begin{aligned}
 W^T x &= \left(\frac{1}{n} \right)^T \sin\left(\frac{2\pi i}{50}\right) \\
 &= \frac{1}{n} \sum_i \sin\left(\frac{2\pi i}{50}\right) \\
 &= 0
 \end{aligned}$$

When $\gamma = 0.95$

$$\begin{aligned}
 W^T x &= \frac{1}{0.95 \frac{1-0.95^n}{1-0.95}} \cdot 0.95^i \cdot \sin\left(\frac{2\pi i}{50}\right) \\
 &= \frac{1-0.95}{0.95(1-0.95^n)} \sum_i 0.95^i \cdot \sin\left(\frac{2\pi i}{50}\right) < 1
 \end{aligned}$$

When $\gamma = 1.05$

$$\begin{aligned}
 W^T x &= \frac{1-1.05}{1.05(1-1.05^n)} \sum_i 1.05^i \cdot \sin\left(\frac{2\pi i}{50}\right) \\
 &< 1
 \end{aligned}$$

The results are inconsistent with the interpretation given above, for $\gamma = 0.95, \gamma = 1.05$, their parameter values both less than 1.

Problem 2.4

Solution: The answer is ϕ cannot be linear, because the value of second point is equal to the third point, if ϕ can be linear, the two values should be negative.

Problem 2.8

Solution:

(a) The integral is

$$\int_a^B p(x) dx = C_1(B-a) + \frac{C_2}{2}(B^2-a^2) + \frac{C_3}{3}(B^3-a^3) + \dots + \frac{C_n}{n}(B^n-a^n)$$

$$a = (B-a, \frac{B^2-a^2}{2}, \frac{B^3-a^3}{3}, \dots, \frac{B^n-a^n}{n})$$

(b) The derivative is

$$p'(x) = C_2 + 2C_3x + 3C_4x^2 + \dots + C_n(n-1)x^{n-2}$$

$$b = (0, 1, 2x, 3x^2, \dots, (n-1)x^{n-2})$$
